

Corrected hybrid AVC: convergence timescales from a WRONG plant seed
seed $|P|=1.41$ @135deg ; measured true plant $|P|=7.22$ @169.5deg

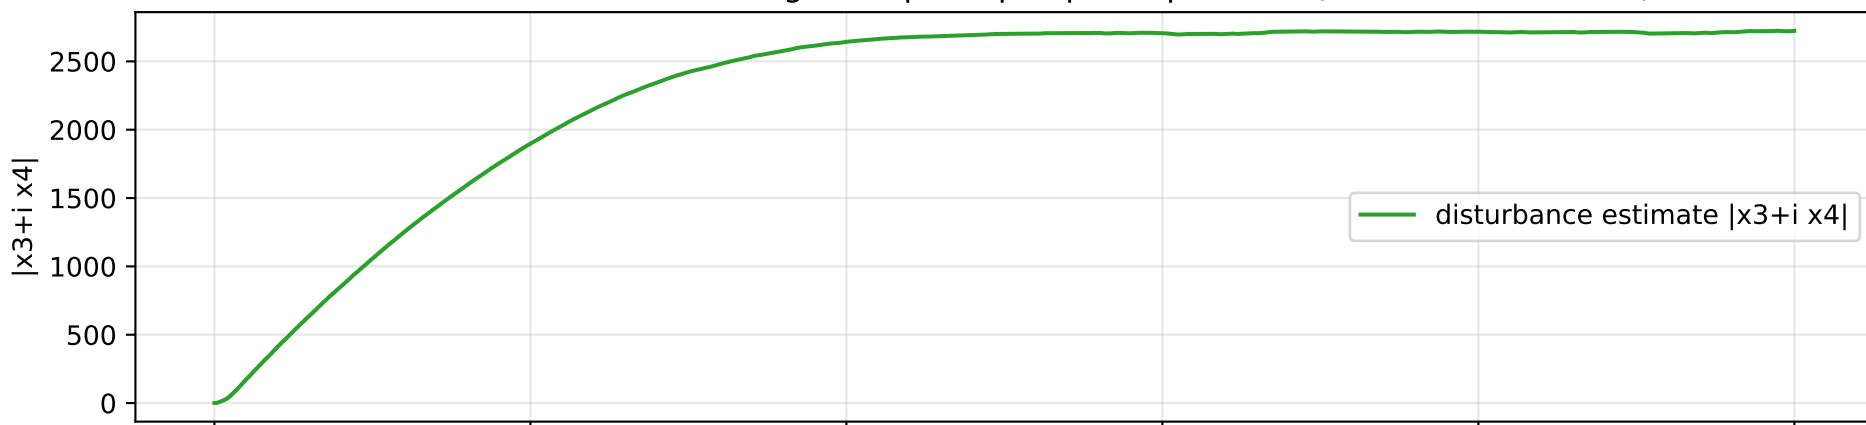

Plant MAGNITUDE: rescales 1.41 $\rightarrow$ ~13.8, settles (not at the true 7.22)

Plant PHASE: frozen at the seed -- the update cannot rotate $\arg(P)$ (unobservable)

Disturbance estimate: integral loop ramps up and plateaus (this is what cancels)

Cancellation timescale: 47 Hz residual amplitude (300 ms lock-in)
